Montrose Medical

Occupational Therapy Visit Summary

Patient Nicole King Date of birth 12/14/1989

Date of visit February 5, 2026 Provider Rachel Hoffman, OTR/L

Diagnosis

Bilateral de Quervain tenosynovitis.

Subjective

Patient is a pianist who manages a long standing wrist condition. She reports intermittent flares two to three times per year. The most recent flare was in mid January and resolved within several days with night splinting and rest. She is back to her usual routine and adheres to a ninety minute continuous playing cap.

Objective

Finkelstein test mildly positive bilaterally, more so on the right. Grip and pinch strength within functional limits. No acute swelling or erythema. Full active range of motion at both wrists.

Assessment

Condition is stable and well managed with the current home program. No signs of progression. Patient demonstrates good insight into pacing and load management.

Plan

Continue night splints during flares, post practice icing, and the ninety minute playing cap. Continue eccentric loading and tendon gliding exercises as instructed. Quarterly follow up, sooner if a flare does not settle with the usual measures.
